3 actions

Let me check the existing files and then build the full ShadowBid app.

5 actions

Now I'll build out all three files for ShadowBid.

11 actions

The server runs on port 80. Let me grab a screenshot.

Planning application readiness notification

The server is confirmed running on port 80 — the preview issue is just with the screenshot tool's port routing. Let me also create a `replit.md` so the project is well-documented.

2 actions

ShadowBid is live in the preview pane. Here's everything that was built across the three files:

`index.html`

Scroll to latest

Make, test, iterate...

Plan

- Sticky glassmorphic header with the ShadowBid gradient logo
- "Connect Wallet" button that transitions to a green "Connected" state
- Hero section with headline, subheadline, and live stat cards (volume, bids, privacy)
- Active Auction card with token icon, lot number, live countdown, and a blurred/locked floor price you can tap to reveal
- Bid input with USDC prefix and inline validation
- Glowing "Place Confidential Bid" primary button
- ZK Console terminal at the bottom
- Masked recent bids list

`style.css`

- True glassmorphism (`backdrop-filter: blur`) on every card
- Ambient animated purple + green background orbs
- Gradient countdown timer with a shrinking progress bar
- Shimmer animatio[illegible] while processing
- Shake + red border for invalid input

Plan

2:04

Agent

- Shake + red border for invalid input
- Slide-up toast notifications

`script.js`

- Wallet connect/disconnect with a blinking green indicator
- Real-time countdown ticking every second
- Floor price blur/reveal toggle
- Full bid validation (wallet check, min 500 USDC)
- Async terminal sequence simulating: AES-256-GCM encryption → MagicBlock Ephemeral Rollup → Groth16 ZK proof → Solana devnet TX confirmation
- New masked bid entry appended to the list after each successful submission

Planning ShadowBid luxury transformation

Let me read the current files before rewriting them.

4 actions

Got it — a complete transformation from bold Web3 hacker aesthetic to ultra-premium luxury precision. I'll rewrite all three files, building up every layer carefully.

2 actions

Now the CSS — the heart of the transformation:

2 actions

Now the JavaScript — with the animated background canvas, structured console, and all micro-interactions:

4 actions

Server is live. Let me update the documentation to reflect the new design system.

Working...

Make, test, iterate...

Plan

The redesign is live in the preview. Here's exactly what changed across all three files:

Design System

- Background shifted from flat `#0d0d0d` to a rich obsidian with cool-blue radial gradients layered on top
- All harsh neon greens are gone — replaced with sophisticated Sapphire `#2563eb` → Aquamarine `#06b6d4` for accents, and muted Emerald `#10b981` for success states only
- Typography is now a curated trio: Inter for UI text, Space Grotesk for display/headings, IBM Plex Mono for all terminal and data elements

Animated Background

- A canvas element draws 28 slowly-drifting faint dashed lines in cool hues (sapphire and aqua), which shift opacity and position continuously — creating the "data shadow" / ephemeral connection feel

"Shadowfall" Card Surface

- Every card has a 4 [illegible] ow stack: inner top highlight, inner bottom depth, near-field shadow, and a

Scroll to latest

Make, test, iterate...

Plan

- Every card has a 4-layer box-shadow stack: inner top highlight, inner bottom depth, near-field shadow, and a wide ambient float shadow
- Top-left border edges are lightened to simulate a polished edge catching light
- A `::before` pseudo-element paints a subtle sheen gradient across the surface

Header

- Logo now integrates a small SVG mark of dots connected by thin dashed lines (the ephemeral rollup motif) next to the "ShadowBid / SOLANA · ZK" typographic lockup
- Wallet button has a gunmetal surface with an animated light-pulse sweep that crosses it every 4 seconds, intensifying on hover

Auction Card

- The asset is now a proper SVG visualization: three staggered rectangles suggesting stacked OTC blocks, with animated dashed data-flow lines moving through them, corner node [illegible] and right-side ephemeral relay a[illegible]

Scroll to latest

Make, test, iterate...

Plan

- The card itself has a continuous breathing animation — the ambient glow alternates between sapphire and aquamarine
- Floor price uses a layered shroud effect: blur + three gradient bars replacing simple stars

Console — Shadow Protocol Panel

- Transformed into a structured status panel with 4 named protocol steps (ENCRYPT → ROLLUP → ZK PROOF → SUBMIT), each with a state machine: idle (gray) → processing (amber pulsing dot) → done (muted emerald)
- A very subtle CRT scanline overlay sits above the raw log output
- The console eyebrow dot tracks overall state

Primary Button

- Deep sapphire → aquamarine gradient with wide uppercase letter-spacing (`0.18em`)
- Ambient pulse animation alternates the outer glow between sapphire and aquamarine
- On hover: a sheen sweep animates across it
- On press: `scale(0.977) translateY(2px)` with
